

## LED lamps - features and applications

Recently, the popularity of **LED lamps** has increased significantly, because they can save a lot of energy. Therefore, LEDs are used in many areas - in street lamps, in offices, hotels, catering establishments. **Ceiling lights** illuminate most concert and theater halls, and such lamps have appeared in many apartments. It is easy to buy such products, because a huge range of models and types of lamps with different light temperatures can be found in specialty stores for an affordable price.

The use of LEDs, as well as **solar lamps**, has several important advantages:

- economy - with the same amount of light, modern **LED lamps** consume 7-10 times less electricity;
- durability - LEDs serve well for several years, usually 15-50 times longer than a normal **light bulb**;
- they do not heat up - the child will not be able to burn his hands on the **LED wall lamps**;
- the ability to install **LED lamps** with higher brightness than conventional bulbs in the lamp, which has a power limit;
- the same brightness at different mains power - if the power is reduced, the brightness of the LED lighting will not change.

Thus, most of the advantages do not compare with the technology of **solar lamps**, but the efficiency and cost-effectiveness of LEDs is obvious.

## LED ceiling lights - features and varieties

**LED lamps** are often used in the design of lighting a room or apartment. The modern market of LED devices offers a variety of models in size, brightness and power, as well as other characteristics.

In addition to the durability and economy of such **bulbs**, ceiling lighting has several features:

1. the design of devices does not require replacement of elements, and also additional service;
2. Disposal of **LED ceiling lights**, if necessary, is carried out in the usual way, because such devices do not harm the environment;
3. all **wall lamps** are reliable, vibration-resistant and strong;
4. the color rendering index corresponds to 75-85 Ra, which coincides with normal daylight;
5. The efficiency of **LED lamps** is about 100%, in contrast to conventional incandescent **bulbs**, which have slightly lower values - 65-70%;
6. in such lighting devices there are no low-frequency pulsations that cause eye fatigue;
7. Lamps work effectively at different temperatures - from -50 to +60 degrees.

They are also simple and easy to install, you do not need special skills.

Question: What are the types of **wall lamps**?

Answer: There are several of them - built-in and overhead. Built-in **LED lights** are often installed in suspended ceilings, but overhead often become a universal option for mounting on walls or ceilings with different types of their design.

### What are wall lamps?

Creation of LED lighting has become a modern achievement of science, because the results of their use are impressive. Nowadays, **LED lamps** are often used to create entire lighting systems in rooms, making the interior interesting and unusual.

**LED wall lamps** are mounted on a vertical surface, so their design must be appropriate. Typically, such models are equipped with **circuit breakers** and have a special mounting system. In addition, **wall lamps** are small in size and shape, which allows you to install the device securely.

Such a **lamp** is often installed in rooms for various purposes - hotels, offices, hospitals, places of public catering. Such options are considered extremely modest and functional **wall lamps**.

A very popular option is a sconce. Unlike **ceiling lights**, such models of wall lighting fixtures are very popular, there are many solutions - different shapes, types and varieties. Since the ceiling in such **LED lamps** is separate from the fastener, it will be easy to choose an interesting option for the interior design of the apartment.

Separate **wall lamps** are distinguished, they can be made in the form of a hanging bowl or a ceiling with a **light bulb**. Such models are no less original and will definitely decorate the design of the room or room.

Among the advantages of such **LED lamps** are:

- possibility to install in any convenient or necessary place for lighting;
- reliable fastening system, which is one of the most important factors;
- relatively low prices for **wall lamps**.

It is also important that you can install an **LED light bulb** on any wall light fixture to save energy.

#### *Special types of LED lamps*

LED lighting, like **solar lamps**, is often used in public, office, and residential areas to save energy and financial costs. Therefore, **LED lamps** are often used in lighting fixtures, while creating interesting interior solutions.

1. Spot **ceiling lights** are more used for stretch ceilings, forming amazing designs with different levels of lighting. They can emphasize certain details in the design of the room, sometimes to hide flaws. Spot **ceiling lamps** often become elements of zoning the room, dividing it into separate zones. Lighting with such devices is cost-effective, as the user can illuminate only the necessary part of the room.
2. LED strips - a kind of **ceiling lights**, which are installed along the contour of stretch ceilings, they can create a cozy and comfortable atmosphere. Such **LED lamps** are optimally profitable, create a beautiful lighting effect and do not heat up.

Each type of lighting is perfectly combined with another, so you can create an interesting design of each room. A useful addition to the lighting system will be the installation of **circuit breakers**.

#### **Why install circuit breakers?**

Everyone is trying to create a comfortable living environment: installing solar lamps to save electricity. Another factor in the convenient use of electricity is **automatic lighting control**.

Installation and further use of **circuit breakers** has a positive effect on quality of life, a person does not spend time on and off the light. Now this is done by a system that controls the level of lighting in the room and controls it. Thus, **wall lamps** work with a lower or higher light output, reducing energy costs. The same applies to **ceiling lights**.

Question: Why install **circuit breakers**?

Answer: Automation of a lighting system has many advantages, among them:

- energy saving - if the user does not turn off the lights at home or at work, you can use the app or remote control to turn off the **ceiling lights**;
- minimalism in design - the absence of switches gives more opportunities for interior design.

In addition, **automatic lighting control** provides the ability to select the optimal level of light - from dim to bright. The choice of lighting mode is sometimes very important, because you can create the necessary atmosphere in the room.

### Modern automatic lighting control systems

Question: Why are **automatic lighting control systems** so useful?

Answer: The advantages of **circuit breakers** are:

1. the ability to control **LED lights** using a smartphone, touch panel or remote control from any location;
2. guaranteed reduction of electricity use by 40%;
3. **automatic lighting control** significantly increases the service life of **LED lamps**.

The latest systems provide for the receipt of several types of lighting - interior, facade and landscape with the receipt of individual structures and the creation of an interesting design.

Control of **ceiling lamps** provides several ways to implement it. The first is performed in such a way that the room is equipped with lighting to turn on the remote control with different buttons. Each of them will be responsible for a separate lighting fixture - sconce, floor lamp, spot lighting system, etc.

The second method involves the installation of special sensors that respond to certain actions by the user. For example, if a person enters the room, the sensor is activated and the **wall lamps** are turned on. To turn off the light while staying in the room, you still have to use manual switches.

Among other features of **automatic lighting control** are:

- brightness of light. You can adjust the lighting level with the remote control or touch panel. Also brightness is regulated by means of the program, in it it is possible to enter necessary indicators and to change them on the timer;
- timer control. You can control the on and off system with a timer - you just need to set the time when you want to turn the **light** on and off;
- time management. On rainy days, there may not be enough light in the room, then the sensor will work, which regulates the level of lighting in the room and turn on the **ceiling lights**;
- light scenes. The system offers the creation of light scenes, turning on several devices that are often used. In this way, you can select the necessary interior elements or parts of the apartment;
- imitation of presence. If the user is often away from home and wants to hide this fact, you can configure the system so that at certain times it turns on and then turns off the **LED lights**. This method of simulating the presence will help protect the home from outsiders during your weaning.

The use of such systems together with **solar lamps** is cost-effective because it reduces energy costs. Such a system will also help in the distribution of lighting, thus identifying the optimal devices that often illuminate the room.

**LED lamps** play an equally important role in lighting control systems. They perform energy-saving functions, do not contain heating elements and have a high service life.

Such lighting elements are important and are often used in luminaires of different types of homes for various purposes. Therefore, the relevance of this type of lighting is obvious, useful and provides a guarantee of savings on electricity consumption.
